

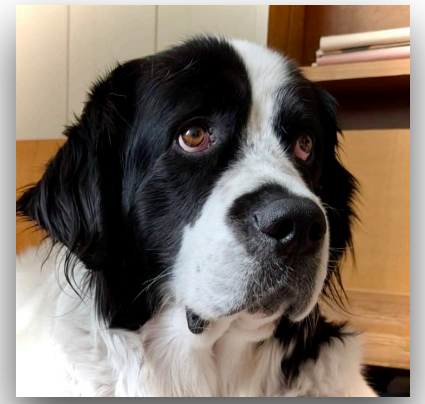
Seven (7) male Landseer puppies from Luna and Batman by natural mating

Luna

Ahyoka-Arthemis vom Baslerland

Borne: November 25 in Hungary
Registration Number: MET.Land.223/22
Lives in Volda, Norway
Shown with ”Excellent”



Health tests
Hip: HD-C = hips grade C (mild display
Elbow: ED-0 = elbows free from dysplasia
Inherited from here parents:
Muskeldystrofi (MD): N/N (fri

Batman

Rävkullens Kummin

Borne: August 08 in Sweden
Registration Number: DK18936/2020
Earlier: SE51415/2020
DKCH SECH
ROV22 KBHV22
During the years many successes and titles in Nosework.

Health tests
Hip: HD-A = hips free from dysplasia
Elbow: ED-0 = elbows free from dysplasia
Trombopati (CTP): N/N (fri)
Cystinuri: N/N (fri)
Degenerativ myelopati (DM-Exon 2): N/N (fri)
Muskeldystrofi (MD): N/N (fri)
Hyperuricosuria (HUU): N/N (fri)
D-locus D1 (DIL): D/D (non-dilute)

A Personal Reflection on Luna

What I value most about Luna is her balanced and gentle temperament. She has no hunting instinct and is kind and respectful towards both people and animals. Luna is a very versatile dog with a wonderful willingness to work and cooperate.

In water work she is incredibly engaged and intuitive. It often feels as if she naturally understands what she is supposed to do, and watching her work is honestly quite amazing.

Last year my daughter attended an agility course together with Luna, and they did wonderfully. Luna truly loves training and working closely with her people.

At dog shows she has received both “Excellent” and “Very Good”. Even though we ourselves are not very experienced in the show world, Luna has always impressed us with her temperament, attitude and beautiful appearance. She also moves beautifully and freely.

The puppies are raised in our living room as part of our everyday family life, surrounded by our children. During their early weeks they will also be introduced to many different animals, including chickens, ducks, rabbits, cats, goats and horses.

Rieke Billerbeck
owner

A Family Reflection on Batman

Batman is a very active dog who truly needs to be involved in everyday life and to keep his mind engaged. That is one of the reasons why Nose Work has become such an important activity. He was deliberately chosen because he was the most active puppy in the litter.

Training has included many different activities such as water work, Nose Work, obedience, dog parkour, and ring training for shows. Working with Batman is an absolute pleasure, as he has an impressive ability to shut out distractions and focus entirely on the task at hand.

At home, having his older father Zip — now 10 years old — nearby has been a great benefit. Zip has taught him many things, including that there is no reason to bark back at dogs behind fences when passing by. 😂 Batman absolutely adores his old father and loves lying close beside him.

Batman is an incredibly loving and gentle dog at home, both towards Zip, family members, and everyone who comes to visit. Around unfamiliar male dogs, however, he can sometimes be more reserved, so a respectful distance is usually preferred in those situations.

There are five grandchildren in the family, and Batman is very fond of them all. 💙❤️💙❤️💙

Relaxed or lazy would not be the right words to describe him — Batman truly enjoys activity and stimulation. Nose Work is something he excels at, and mental challenges are very important for his well-being.

After a good training session, though, peace and quiet finally settles in. 😴💤

Henriette and Björn Steiner

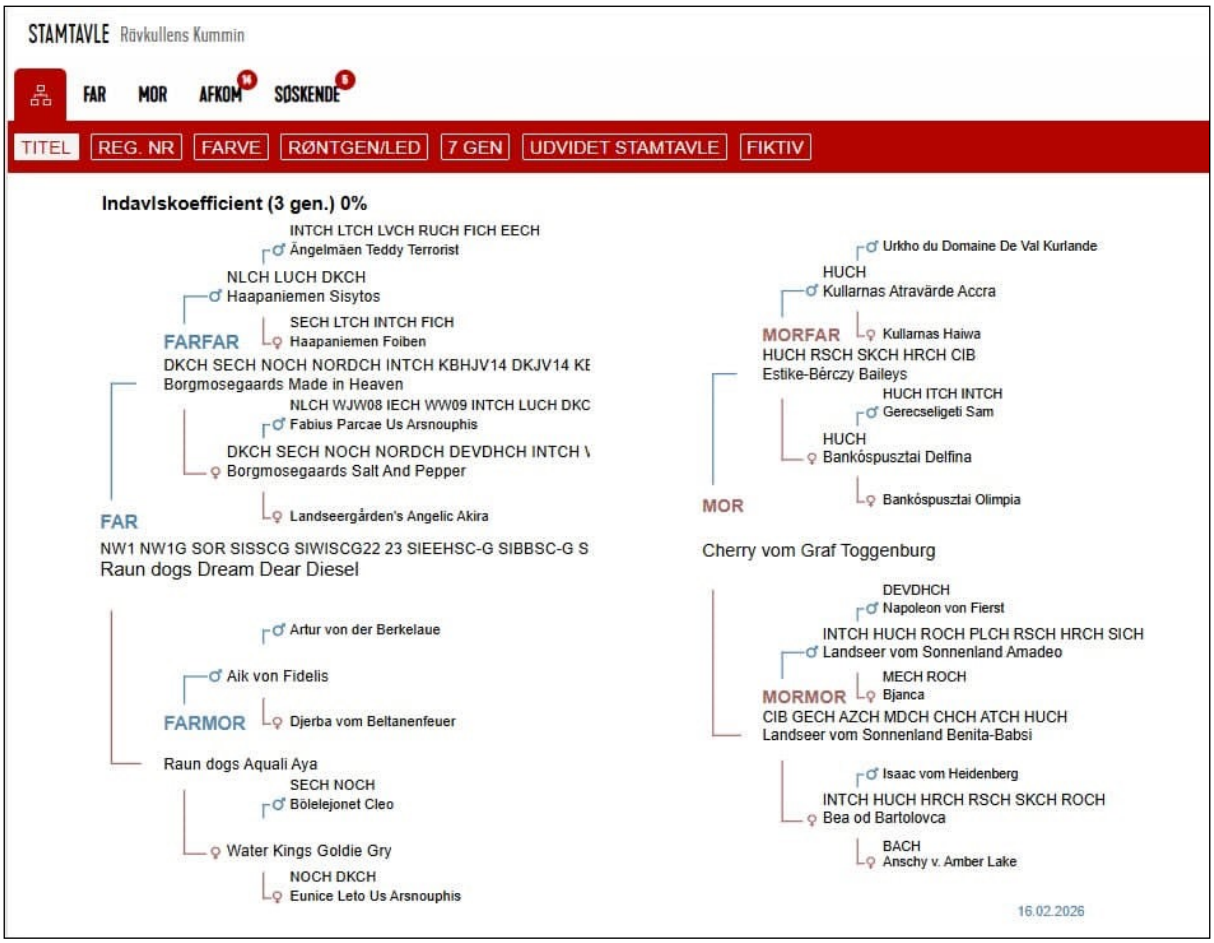
Pedigree Batman



Breeding Analysis – Summary and conclusion

This analysis concerns the combination between Ahyoka-Arthemis vom Baslerland (METLAND223/22) and Rävkullens Kummin (DK18936/2020) earlier (SE51415/2020). The material is based on complete pedigrees from DogWeb and SKK Avelsdata.

Both individuals have an inbreeding coefficient of 0.0 percent in their own pedigrees. This means they are each built without mirroring between paternal and maternal lines. This provides strong genetic breadth and a safe starting point for controlled linebreeding.

The bitch carries a clear Eastern European core line through Kullarnas Åtråvärde Accra, Estike-Bérczy Baileys and Bankóspusztai Delfina. This line is known for substance, head type and stable temperament.

On the dam's side, the bitch carries the Val Kurlande line combined with Arsnouphis and Baltic lines via Nemunas Grafika and Halia Boreas Us Arsnouphis. This contributes movement, topline and balance.

The male carries the same Eastern line through his dam Cherry vom Graf Toggenburg, and Val Kurlande blood through Urkho Du Domaine De Val Kurlande. The lines therefore meet in a controlled and well-planned way.

In this combination, linebreeding occurs on Accra, Estike-Bérczy and Bankóspusztai, with a mild reinforcement of Val Kurlande. No individuals are in hard positions such as 2,2 and no genetic bottleneck is created.

This strengthens type, substance and mental stability, while movement and construction remain balanced.

The conclusion is that this combination is genetically strong, well balanced and technically correct. It reinforces the right lines without narrowing the gene pool. This provides very good conditions for type, stable and functional offspring and a secure foundation for continued serious breeding.

Extended

Breeding Analysis –Landseer between Ahyoka-Arthemis vom Baslerland and Rävkullens Kummin

This analysis concerns the combination between the bitch Ahyoka-Arthemis vom Baslerland (METLAND223/22) and the dog Rävkullens Kummin DK18936/2020) earlier (SE51415/2020). The material is based on complete pedigrees from DogWeb and SKK Avelsdata, with focus on line structure, common ancestors and breeding balance.

The starting point is exceptionally strong. Both individuals have an inbreeding coefficient of 0.0 percent in their own pedigrees, meaning they are each built without mirroring between their respective paternal and maternal lines. This provides maximum genetic breadth and makes it possible to use linebreeding in a controlled way without risking close inbreeding.

The bitch is clearly line-typed without being linebred. On the sire's side she carries a consistent Eastern European core line via Kullarnas Åtråvärde Accra, Estike-Bérczy Baileys and Bankóspusztai Delfina. This line is known for substance, head type, stable temperament and strong breed character. On the dam's side she carries a pure Val Kurlande line combined with Arsnouphis and Baltic lines via Nemunas Grafika and Halia Boreas Us Arsnouphis, which contributes movement, topline, proportions and elegance. These two blocks do not meet in her pedigree, which is genetically very valuable.

The male Rävkullens Kummin in turn carries Nordic, Finnish, French and Hungarian elements, but through his dam Cherry vom Graf Toggenburg he carries the same Eastern line as the bitch, namely Estike-Bérczy Baileys, Kullarnas Åtråvärde Accra and Bankóspusztai Delfina. He also carries Val Kurlande blood via Urkho Du Domaine De Val Kurlande.

When these two are combined, true linebreeding occurs, not inbreeding. Kullarnas Åtråvärde Accra appears in the 2nd generation on the bitch's side and the 3rd generation on the dog's side, giving a 2,3 line. Estike-Bérczy Baileys appears in the 3rd generation on the bitch's side and the 2nd generation on the dog's side, giving a 3,2 line. Bankóspusztai Delfina appears in the 3rd generation on both sides, giving a 3,3 line. Urkho Du Domaine De Val Kurlande appears in the 4th generation on the bitch's side and the 3rd generation on the dog's side, giving a mild 4,3 reinforcement of the Val Kurlande line.

This means that three stable core lines are reinforced simultaneously, without any individual ending up in a hard 2,2 position and without creating a genetic bottleneck. It is a conscious, mild to moderate linebreeding that gives effect without becoming risky. The combination strengthens head type, substance and mental stability via Accra, Estike and Delfina, while construction, movement and balance are reinforced via Val Kurlande.

There are no signs of aggressive inbreeding, no narrow genetic structure and no hidden close mirrors. On the contrary, genetic breadth is maintained because the bitch's Val Kurlande and Arsnouphis blocks are not heavily mirrored on the dog's side and because the dog also carries Finnish and Nordic lines that are not present in the bitch.

From a breeding perspective this is a very well balanced combination. It is line-dense enough to give predictability in type and stability, yet broad enough to avoid increased disease risk and fertility problems. This is exactly what correct linebreeding looks like when it is thoughtful and strategic.

The conclusion is that the combination Ahyoka-Arthemis vom Baslerland and Rävkullens Kummin is genetically strong, logically built and technically correct. It reinforces the right lines, avoids close inbreeding and preserves genetic breadth. This is breeding work at a high level and provides very good conditions for typey, stable and functional offspring, as well as an excellent foundation for continued serious breeding in the next generation.
